Thread: [Hoge will be the next meme to sky rocket after Shib](#)

Boney - October 6, 2021, 11:04 pm

So Doge spiked early this year, Shib (which was built last year) is soaring to new records (\$14b+).

Another coin called Hoge, (which is Doge but De-Fi) was built this year in feb. 2021. This coin is ~50m market cap but could easily light on fire if the cards play out over the next few weeks.

Link to Website: [Hoge.Finance](https://hoge.finance)

Link to Whitepaper (if applicable):

https://hoge.finance/wp-content/uploads/2021/09/hoge_whitepaper.pdf

General Description of the project: ERC 20 community-driven Defi meme token. Unlike shib/doge it solves the inflationary supply problem by being the first to create burn tokenomics. It has a 2% burn on each transaction. With a total supply of 1T, already 600b is forever burned over these last few months leaving only 400b.

Thesis: This coin set a record back in March for being the 2nd fastest growing erc coin (behind eth) by going up over 1,000,000%. The original founder tried to rug the project by yanking out all the liquidity when it unlocked. However, the community took it over and has fought hard to make it grow.

In fact, the current developers, have gotten a legal entity registered, an independent audit from Certik, and got the coin listed on a top25 exchange (bigONE) and top10 exchange (gateio) as well as a bsc bridge for it to trade on pancakeswap. Now they are building out an NFT marketplace, and hogeswap platform on top of many more other things. What is crazy is they have an NDA in place with a top 5 exchange that will list them the second the community funds hit \$500k. Already \$100k worth is raised. (meaning a 5x will instantly hit that goal)

Here is where things get interesting. Bitcoin bullrun is here and strongest in the winter months. That is going to trickle over into all the alt coins. Doge is 20000m market cap, shib is 11000m market cap. Hoge is still only at 50m.

Remember how I mentioned the founder tried to rug, well that left the uniswap & pancake swap liquidity lower than normal. (given the market cap). This low liquidity is a double-edged sword that has so far been working in one direction as early /biz/ adopters scramble out the door with measly 200-800% gains. But now with less than 6 billion HOGE in the LP, this token is going to get scarce quick. One whale (or a school of guppies) can kick off a cascade of catalysts as follows:

\$2.6 million on Uniswap slips the price up 5x, putting the value of the public donation wallet past the target with no further donations. After that there's a scant ~1.4 billion HOGE left in Uniswap. A major exchange listing draws attention and listings from at least 2 other exchanges. Non-Hoge-pilled individuals have been so thoroughly shaken out that for remaining holders, HOGE is as good as gold.

That's why if Hoge goes up 5x it goes up 200x. I hate to use the word squeeze because of the Gamestop saga, but we are about to see a price constriction so acute and dramatic that people will wonder why they didn't buy sooner.

You're thinking ? but doesn't everyone say 100x this or 100x that. No just stop. This isn't a catchphrase. It's at 50M market cap. 100x won't even make it half of shib. 200x still won't even reach shib market cap.

Again shib was a coin nobody heard of last year. Again Hoge is not shib. It has better tokenomics, meaning the burn will also help the value as this takes place. The missing piece is the fact Shib is listed on top exchanges, but you bet if/when hoge get listed on top 5, everything will fall like a domino as there are not other meme coins with this level of development.

Look at the chart action, we already saw a bottom out occur, followed by a consolidation phase where the price failed to go lower. Volume is picking up and a reversal is happening. It could very easily break out.

TL-DR: Don't bet your life savings on this, but do maybe give it 1% of the portfolio and perhaps it will pay off end of year.

This is not a skyrocket.

4 decimal places wouldn't even qualify to be listed a a stock. Now if you got in at 5-6-7-8 decimal places, sure you made some cash but unless this thing hits .01 it's hardly a skyrocket
So I don't know where you are looking at that chart, as it doesn't look accurate.

However, it currently has a 51m market cap.

If it does follow through and get the top-tier listing, it likely could go to a 4b market cap.

Giving it a \$0.01 price. Which \$0.01 is 100x larger than its price of \$0.0001. Now, this assumes supply stays the same, which is not possible. With that level of volume, we could see a small bit reduced making the price even higher.

(Oct 6, 2021 11:21 PM)Lowkey Wrote: [\[CITE\]](#) This is real time data 1min chart on Kucoin. What are you talking about it's not looking accurate? This is literally the real time order-flow and buy/sell data vs the current coin price.....

I'm guessing you are new to crypto then...

The supply wont stay the same which tells me you also have not done any homework on it.

They are burning a large amount of coins soon as well as a robinhood listing coming up.

HOGES is a 4 chan meme scam and I'm not sure if you were paid by the telegram group (Which I am also in to keep tabs on HOGES because I have some) to pump your own bags but everyone knows this. That's why the HOGES holders have to ride on the SHIB hype because nobody is buying HOGES.

I'm not trying to be a douche I'm just stating the %100 facts. You do not know what you are talking about here.

Okay well Hoge isn't listed on kucoin so you're making stuff up now. Secondly, not sure where the 4chan meme scam came from as I haven't heard anything about that. Also, I'm not paid for this nor am I aware if they have paid other people for posts. Lastly, check a chart and you'll see that there are indeed people buying hoge.

If you have some hoge but you think it's a scam get out of it then. This post is intended for people other than you that want some good altcoins to consider.

Haven't look at Hoge in quite some time. I'll pop into the tg and talk shit for a bit.

ive seen and heard many MANY catch phrases and tOkEnOmIc cOiNs with this and that. In the end like you said it gets rugged and thats that. The community are degens trying to shill and so are you. There are 1000000s of other coins like this and only a couple make it to main stream markets where it actually "moons" like doge and shiba. So this meme coin is another 1 in a million chance of it mooning. I wouldnt invest based on the stupidly high risk shitcoin.
