Thread: [Zano Privacy Coin Founder Of CryptoNote](#)

SrNova - October 13, 2021, 6:46 pm

Hey guys would love to hear your thoughts on this coin.

Currently 30m mcap.

Have been adding privacy coins to my portfolio as i feel the need for them now is more important then ever, i see the whole privacy industry growing exponentially.

Been on the prowl for a while and Zano is the best value for money i could find with some exciting advancements in privacy. The founder helped build cryptonote protocol. CryptoNote protocol is what Monero XMR was built off, Andrey Sabelnikov was behind that protocol he is also known as crypto_zoidberg.

Also a photo was seen recently of Roger Ver and the team from Zano. If you don't know who Roger Ver is he was an early adopter in bitcoin in 2011, he is a early investor in bitcoin cash, the move before zano was XinFin. He is an advisor for XinFin which i invested in when it was 0.004c, there is no context if he is apart of zano or not but some speculate he owns a fat bag. You don't really ever see him talking about projects or shilling projects, so i think that we see him in a photo with the zano team is very cool.

Another positive is the team have a foundation fund wallet that is completely transparent with the public, anyone can watch and see where the funds are flowing to and from. I also like the professionalism of there website, discord, and telegram. You can actually speak directly with the founder at the moment.

A problem exists in monero that imposes certain restrictions in anonymity. Monero uses an anonymity set 10 by default. Monero signature works linearly where as zano works logarithmic which means it does not need to follow a guideline in a linear manner. By doing this they increase the anonymity of a transaction from 10 different address's to 100 plus. The only issue with this is the block size drastically increases but they are working on solving this problem, if they achieve this obviously the security and privacy is increased drastically. I think they plan on doing this by sharding.

Zano is also a relatively small supply with only 12.8 supply as of today, but the supply of zano increases 500k per year which is quite nice.

The next cool feature Zano has created is Aliases which are unique non-fungible id tokens or (NFT). Your secret identity in the future on Zano.

I saw some people bag my previous thread so i'm making this one more professional, i'm not trying to sell anyone anything. Do your own research and tell me your thoughts, looks like a interesting project from my perspective.

Zano current mcap is 30m with a price of \$2.70. Zano is trying to target the commerce sector which means your every day purchase of items etc.

Here is some upcoming things to look forward too.

Hope you guys enjoyed this thread, tell me what you think! Here is all the information for Zano! ?
