Thread: [\[\\$40-75\] Add to Python 3 script or write in a different language](#)

Lenovo - October 24, 2021, 5:53 pm

I have a Python 3 script that reads a text file line by line and sends three API requests and does things based on the `resp.status_code` and `resp.json()` for each line. I need this code to be modified or rewritten in a different language to use a `proxies.txt` file and rotate through each proxy per line in the first text file. When the proxies are all used it goes back to the first proxy. Before the first API request in the current code I need you to send a API request to register an account using a random first name, last name and email. You will need to intercept the API request in the browser that is sent when you register and throw an error if it fails. Also you should test the proxy before sending any API request and if it fails go to the next proxy and test again. You will need to find a way to get a Bearer token from the API which may involve the register endpoint, adding a payment method page or the API requests sent when loading the page, a different API request or unlikely but possible, in the website's JavaScript. If you can do this add me on XMPP: `lucifer@0day.im` or PM me and we can get started. I will be paying via BTC.

`[contract=tid]Start Contract[/contract]`

Personally with the amount of effort this will probably take, I would probably charge more. It depends on if you know exactly what the API is or if I need to reverse it/figure it out myself and how well made the current script already is. If interested give me a DM.
