You're kinda late on the scene, as a lot of Java users have already updated to the latest version(s) which isn't really affected by log4j

Also, if you're looking to do this in Minecraft/Java-Based Games, I advise you do it to servers that seemed to have no update whatsoever since the vulnerability was discovered to have the highest chance of success, which is low nowadays.

This is my take on it of course, which is very likely wrong to some extent in one aspect or another, mainly because I didn't pay attention to it myself.

Also, the tools are out there already, go get it yourself. As for customary things that are specific to a server/website/application, then I advise you have someone code it for you (Paid), or do it yourself.

Mind if i ask what are some of the keyword names of these tools ?

Thanks
