Thread: [100% outlook box inbox hit](#)

chritech - December 24, 2021, 1:01 pm

I am in need of anyone who has a tool. SMTP or whatever that can help my spam letter hit inbox on outlook domains. If your terms are fair enough, we can work together.

(Dec 24, 2021 02:26 PM)Dyne Wrote: [\[CITE\]](#) It depends on a few things.

1) what are you trying to attach? If its a macro doc, probably not. You have to link it from a proper domain.

2) how FUD is your letter ? you NEED a FUD letter to make it work. Watch your wording in the letter, there are certain words or combinations of that will junk your letter immediately.

3) are you using Sendgrid SMTP ? If so, you need it verified with your domain and nameserver. Well what i am trying to attach is an html outlook scampage.

The letter is alot FUD to the best i can see except if there's something wrong.

I have also tried some SMTP that hit inbox for a while then starts junking. What i need is someone who is currently spamming outlook and cant give me a guide to follow. I don't mind paying for this as i honestly do need it.

To hit inbox with outlook or any other provider, there are several parameters to take into account.

For spam and mass mailings, you won't be able to do this with a simple SMTP.

Be interested in ip rotations or SMTP server rotations.

It will also be necessary that you are a domain of 1st level (the ip of the server and the domain are of course very important) and of course, all the configuration MX, SPF, DKIM, DMARC well applied.

Then, once your server is in place, you have to be seen as legit and safe by the providers, so there is still some work to do for that.

All this done, it will justify your score inbox and on mass compaigns

And as Dyne said, your html letter must avoid certain key words that will be banned directly by the filters

Good luck :)

the whole process you have stated here look very complicated. Do you think this is achievable? Have you sent out spam letters using this means you've stated?

(Dec 24, 2021 04:38 PM)Dyne Wrote: [\[CITE\]](#) HTML doc is fine, but you need encryption in your letter. You can't have words like "Microsoft Outlook Login" or... "click here to log in to your outlook account", "please sign the forms attached for \$\$\$" whatever.

If you do, it must be 'encrypted'.

You need variables in your letter too, like [datetime] for example, [TO_USER], [unsubscribe] and so on.

If there is repetition of the same letter over and over, and one person marks it as spam it will destroy all letters sent of like build, and definitely destroy same letters on the SMTP.

I used to teach a spread school which focused on SMTP spreading just last year, however I became much too busy with other projects.

How do i even get to encrypt the letter to start with. Also i want to know if you have resumed teaching on SMTP. i will be more than interested to join the class
