Throwing this out here,

Backend TG notifications

Too long to see: Watch from 02:05

[Video: <https://vimeo.com/660768337>]

It still isn't finished got some idea's which I'm working out but it's been generating between 5-12% on the balance on a daily basis now with some situations like last night and today where it made 22% in the past 9 hours due to bogdanoff dumping on everybody.

Also there are 3 tiny bugs which will be fixed tomorrow (can't lose money cause of this bug), basically the bug is the bot can't handle all the incoming signals if I get 10 signals in 5 seconds lol which means I'm missing out on signals. The other bug is the notifications in TG which needs to be queued so because there are too many notifications in a few seconds

Webpanel:

Got 2 accounts set up and 1 account which is I'm setting up as I'm typing this.

Will post the binance future history in a month with detailed results.

Bot when I was sleeping last night..

Idk whats wrong with the video stuttering but yea check it out!

Things I've updated after this video:

Profit calculation is working better now (It sometimes showed wrong profit calculations)

Stoploss to breakeven feature is now set at 0.08% above or below entry depending on going long or short (sometimes slippage made sure that there was a minimal loss but when having a 20k account that loss is still \$20) <-- which is now resolved!
