Thread: [Command-Line File Encrypter](#)

**MiguelSanchez** - February 1, 2022, 7:17 am

Rubik's Crypt:

Usage: Options E to encrypt string, D to decrypt string  
EF to encrypt file (must also have an output name after the password)  
DF to decrypt file (must also have an output name after the password)

rubikscript Directive Input Password (OutputFile?)\

e.g.

```
rubikscript E "Encrypt This String" Password
rubikscript D "Decrypt This String" Password
rubikscript EF filetoencrypt Password outputname
rubikscript DF filetodecrypt Password outputname
```

To install it into your command line (and therefore all your future programs via os.system)  
create a batch file rubikscript.bat as follows,

Code @echo off

python C:\Users\User\Documents\CMD\rubikscript.py %\*

and make sure to put the batch file in on of the directories in your path (start menu search -> edit  
the system environment variables -> Environment Variables ->path)

Here is the python script,

rubikscript.py

[paste]

<https://pastebin.com/shNUGhMs>

[/paste]

I hope someone enjoys it. Sorry for the lack of comments, check my post history for a description  
on the cryptography board (this version is more updated than the one I linked there, finished  
hopefully)
