Thread: [Crypters for Companies](#)

I-GANK-I - February 4, 2022, 2:47 am

Hi,

So I have been looking a while here but I can't find anyone selling crypters to companies.

I am looking for a legitimate business who sell's crypters for purpose of software protection to other businesses (B2B Software Security Firm).

The thing is, I would like to buy this as an asset for my company but I would need to receive an invoice for it, pay taxes for it and probably sign some other papers with the developer as to cover some responsibilities.

The problem is that here in the netherlands crypters from forums like HF are considered tools which are mainly used for the purpose of committing a crime and are therefore prohibited by law unless there is clear evidence that all parties involved in the contract serve no other purpose but ethical purposes.

So if you guys know any official company here in the EU which sells this kind of software or can develop this kind of software than please do let me know :)

FYI, the law I am speaking of is called: Artikel 139d lid 2 a Wetboek van Strafrecht

I appreciate your answer, its true there are many obfuscation software out there.

But none of which are similar or as straight forward as what you can find here on the forum.

Do you know any crypter developer? perhaps I could get one custom coded.

The reason no big anti-cracking solutions exist in the white collar section is imo very simple.

They cant protect your software, only attempt. So far i have never heard of anything that is entirely secure. Thus they would make false claims and quickly have a stack of cases against them for false promises.

On hackforums majority of crypter buyers dont even know what the tool do, how it works or anything of that sort. Thus failing isnt really a problem, they only care about antivirus. It is 100000000x times easier to beat antivirus, then it is to properly secure a software against decompiling, in the big game.

So no, i dont suspect you will find any legit business claiming they can do this. Steps can be taken to make it harder, but never impossible

what it do?

Why isn't it a magic FUD button?

ENHANCE.

i dont know bro, he take something called stub and put it into file. then antivirus gets confused i think. I am also confused, what is stub even?? Its very complex. he put stub into file but file still get smaller ??

I try enhance stub by pumping him with bytes - But i lose all bytes gambling. What to do now
