How to Play Pokemon Legends Arceus on PC

Downloaded the Pokemon Legends Arceus ROM file which is the .XCI game file that should be required in order to load into the Emulator.Rom File download

Download the Ryujinx Emulator from here

Download the latest Firmware and Prod Keys from here

Run the emulator, go to file, open the Ryujinx folder and paste the Prod.keys file to system folder

Go to tools, click install Firmware and select the downloaded Firmware

Add the Pokemon Legends Arceus ROM file (.XCI) in game directory inside the Emulator general settings

After adding it, the game will appear on the list, double click and it will run

In case you have an Amd graphic card, game might run but characters might not appear, fix it by following the steps below :

Download Ryujinx Vulkan Backend from [here](#)

Extract it using 7Zip, it won't work if you try extracting it with winrar (not sure why though)

Run Ryujinx from the extracted folder

The game now should run without any problems, hope it helped enjoy :)
