Can someone who is interested in helping me send me a private message regarding private dorks if you have any knowledge about these start a convo with me if you even have any knowledge about making them get in touch

clonejaim - March 3, 2022, 5:07 am

try in google

filetype:php intext:"YOUR SEARCH WORDS"

KillSwitch? - March 3, 2022, 5:10 am

Github has a ton of fresh and really good dork lists covering many things like whitehat, blackhat, and a lot more.

Take an example of them for the syntax if you want custom ones, and update keywords :)

Ghost_Exodus - March 13, 2022, 11:00 pm

You really won't need private dorks, as you call it. What you could do is take the 2022 dork list that's being passed around and modify the search strings to query google to send back specific results pertaining to what you really are looking for. Like remote desktops, for example. Because if you try to pwn all the targets in a dork list, you'll find that you're terribly late to the party and everything has been pwnt. lol

For example, one of the dorks in the 2022 dork list is: inurl:edu "login"

But change it to any domain you want. like: inurl:gov "login"

OR

inurl:mil "login"

Thats an extremely simple example. If you want more examples, you really should experidment with modifying the search strings in order to get different results that other people might not have thought to search for yet.
