Thread: [Very easy WiFi passcode hunting](#)

JTheRipper - February 12, 2022, 10:56 am

So recently I've been doing this as a past time around town , and I thought I would share it.

Basically, I've been going to places with display computers (London Drugs, Best Buy, Staples, etc.) and heading onto the command prompt on one of these display computers to type in some commands that show the wifi passcode of the place. Once I get the code, I connect my phone to the network and get free wifi. It's really fun and easy to do, so I'll show you how to do it.

Step 1: Head to a place with display computers

Step 2: Make sure no employees or people are watching you. They will mistake you for a "SP00KY HAX0R"

Step 3: Go on to the display computer and open command prompt

Step 4: Find the name of the network.

Step 4: On CMD, type in "netsh" and hit enter.

Step 5: Type in "wlan show profile nameofthenetwork key=clear" and hit enter.

Step 6: Navigate to key content and it will show you the password.

Step 7: Connect your smartphone and get free wifi.

I hope you will use this, since it's pretty fun to do.

Industri0us - February 12, 2022, 8:05 pm

hmm sounds pretty interesting thank you ;)

zagot2 - February 14, 2022, 4:22 am

how do i navigate to key content, whats that?

i know nothing about wifi hacking sorry

After you type in the commands on command prompt, keep it open and it will show all the wifi info. You'll find it.

If my explanation was a bit broken, just watch this video.

[zagot2](#) just wanna add -

Fastest way to command prompt without a mouse is Win+R then type "cmd", then press Enter.

After that, follow JTheRipper's given commands.

Cheers!

I'd also like to add one thing: Where I live these display computers often have some kind of ad playing and you cannot use mouse and keyboard. If that's the case, you can usually 'escape' the ad playing with Ctrl + Alt + Del. :)

I just move the trackpad or mouse around and it usually exits the ad.

I also made a batch data that make it easier with just press some buttons...

First it shows you all saved wifis in the device then just type the name and it show you the password if you like to save it just press another button and it create a .TXT FILE....

Also working on USB, so just put it in a pc you like to get the wifi pw from...

BugHunt3r101 - March 31, 2022, 12:54 pm

Bashbunny or rubberduffy would work great in these types of scenarios! Great idea by the way JTheRipper!
