Thread: [High quality thread design](#)

Don Cezar - March 8, 2022, 10:48 am

Hello. Any ideas on how to maintain quality when uploading thread designs onto the forum? They always lose a lot of quality for some reason. Using png at 1920x???? pixels.

That mostly depends on where you upload it and how you made your TD.

I use imgur, not sure about your other question though. On imgur it's still very sharp, but as soon as it gets posted on HF, it's ruined.

You're using the i.imgur link right? I think you have to but just checking just in case.

Herbert - May 16, 2022, 10:46 am

The problem with imgur is that it does compress your uploads, it would be better to use alternative image hosting services.

I would also recommend using 1200 px width for thread designs and make sure you have the resolution set to 72 ppi.

Cyam - May 16, 2022, 4:05 pm

Don't use 1920x

As Herbert said, 1200px is the best width for thread designs.

It's possible that you always get LQ photo because HF forces the decreased size so it turns out blurry.

Upload your images to imgbb. com and always export as .jpg...imgbb will keep your quality!
