Thread: [.net dependency question](#)

cannibalherd - March 16, 2022, 8:03 am

if my file need .net 3.5 to run and machine has .net 4.5 + installed will my file open and run successfully?

| x | - March 16, 2022, 10:02 am

Yes.

You can test this on virtual machine.

no, Windows will ask you to install the missing components.

Usually 3.5 is included in Win 10.

small correcting.

Usually 3.5 is not included in Win 10 and is required to be installed.

Vuln - March 16, 2022, 1:41 pm

It is always included as Windows Feature, but usually disabled by default (depending on how Win 10 was installed).

Enabling the feature will download it through Windows Update.

If it is disabled and you execute a .NET 2.x/3.x app, you will be asked to enable the feature. Your app won't just crash.

This is correct.

benio2 - March 17, 2022, 8:07 am

Use .net framework 4.0 for development right now if you want your software to be able to run on any Win10+ pc.
