(used translator)

How to prevent my hacking tools from being detected by antivirus?

i'm knowing encrypt the hacking code is solve this problem, right?

but i dont know how to encrypt hacking code

how to ?

U can code ur own Crypter. which is better since buying a crypter Has Shorter FUD time than ur Own private tool.. If u still want to buy the least u can buy is a private Stub. Or a private crypter / Crypt.

Good Day.

You are right on encryption, but also missing obfuscating.

This makes the code un-readable, harder for systems to scan and understand what's happening, even with some potential anti virus checkers to ensure that the piece of malware is not ran in certain conditions, making it pass as fully undetectable.

But as others have said, you want a private crypter or at least a private stub, else it will only be undetectable for a very short time.

Yes, crypters is the easiest way to make sure your files doesn't get detected and blocked...

Somes loaders also disable antivirus and/or are fileless wich make it harder to be detected
