Thread: [Infiltrate PHP language + apache server](#)

xiaotian6689 - March 28, 2022, 7:29 am

I need hackers who are familiar with the PHP language, the site is PHP language 7.3.2, the server is apache, the real IP has been acquired, there is no security protection, I am already familiar with the tricks of scammers, scammers do not bother me, interested professional hackers send me a message Thank you. My telegram is: @xiaotian1368

most critical vulnerability with php 7.3.2 as of now that is publicly available is just information disclosure (which is laughable)

This site protection is very poor, no firewall, moderator also configuration site error, and is Apache server, moderator panel I also found the address, Internet Protocol Address also found, but my technology is not good to enter. Can you get in, brother?

unless their configuration is default, you can (for educational purposes and hypothetically speaking) spray passwords

He does not have any service hosting, I am using the Internet Protocol Address to access the moderator panel. Blast password is not useful, he set a white list, can you get it, brother

I used my mobile phone to access the Internet Protocol Address to display the moderator website configuration error. I need to click Continue Access to access successfully.
