Thread: [Anyone dabble with Nootropics / Smart brain drugs?](#)

Virgo - April 3, 2022, 9:14 am

On this Forum it would be something that would come in beneficially given the type of work it is. Check out the SubReddit if you wanna dig deeper into that world. <https://old.reddit.com/r/Nootropics/>

I am currently trying out Cerebrolysin it is an injectable molecular derivatives from pig brain. The theory is you get all the neurotransmitters etc. in a solution and into your own and that's theorized to bring the benefits.

Another one is Tyrosine which is good for dopamine the fun neurotransmitter. And Whey Protein in high dosages also bring a lot of brain-effects and energy.

Racetams are quite interesting aswell, stuff like pircateam and aniracetam etc. Always stack those with choline though.

Noopept is also a very effective nootropic.

hotwheels52 - April 4, 2022, 5:55 pm

I've very briefly heard of people doing treatments like this and am interested in learning more about risks vs. benefits.

XMR - April 4, 2022, 6:46 pm

Cerebrolysin is the most effective nootropic I've ever used. IMO the only downside is that it has to be given through IM/IV injection.

Apart from injectables, noopept and phenylpiracetam have been very good. I've found pramiracetam to be quite useful for anxiety though it dulls out all other emotions as well. Supplementing choline, alpha-GPC, and B-vitamins can also go a long way.

Though these are only my personal experiences, the experiences of others can be similar or they may be very different.
