Thread: [Basic Serial key gen and HWID validation](#)

joshuagress12345 - April 23, 2022, 9:34 am

Yo basically I was looking for something like this yesterday, didn't find anything thorough enough and decided to make my own.

This was done in a couple of hours and there's way better ways to store data than private pastebins, but I still wanna share it because a lot of you could probably use something like this and it's a nice template for beginners (like me). I got a bunch of comments in the source trynna explain what I'm doing.

Check it out (can't rly post links yet): github.com/joshuagress/Keygen_HWID_validation

Looking forward to hearing some of your opinions :)

So I tried it, but the console closes as soon as I execute?

Klonopin - March 10, 2024, 1:48 pm

You probably wouldn't want to use pastebin for hosting your hwids.
you can find an free php host and do all these via php & whatever language.

yeah... recommend this as well. OP, if you really need something that's not hosted on your own server, maybe look into IPFS pins, but this will be much slower and could go offline in future if nobody re-pins the data or accesses it on public nodes.
