Thread: [How do you make a python downloader? / download and execute a .js payload](#)

ZeroGay - June 5, 2022, 1:32 pm

I need a python script that simply downloads a js file from Web and then executes it.

Please, your input is highly appreciated. Thank you in advance.

download it using `requests` or `aiohttp`, then execute it using `subprocess` or something. not sure how you expect it to be executed considering python doesn't have a builtin js environment

Thanks for the reply. I guess it's not possible to make a python download+execute a js file? O_O

it's not "not possible", it is possible, but it depends on the complexity/dependencies of the js code, easy and straight forward method can be seen [here](#)
