Thread: [Esea and Faceit anti-cheat](#)

blaqk - June 9, 2022, 6:18 am

Are they as good as they say they are?

I developed a cheat more than a year ago for csgo. Obviously will never disclose my methods but the methods I am using is out of the box and not your typical bypass. For me to bypass these so called "FBI" anti-cheats was actually no sweat and I achieved this with no dma or kernel drivers.

I honestly believe that these anti-cheats detect cheats more from manual demo analysis rather than the cheat itself. I also believe most cheat developers are so paranoid with these anti-cheats cause they go above and beyond with dma and kernel drivers. It really doesn't have to be so complicated.

I do not believe faceit has an FBI system and reading that on their website made me laugh and the same can be said for other anti-cheats. I think its in their best interest to make people paranoid to make them afraid of using cheats or developing cheats.

I have a few people including me using my cheat on faceit, esea and others for a about a year now.

In opinion I reversed faceit and esea anti-cheat and I have to admit they do have clever ways of detecting cheats especially kernel drivers but there is so many loop holes for cheat developers.

You're asking "Are they as good as they say they are?" while claiming to have a cheat that has been working for 1+year.

Do you realize how fucking dumb you sound?

I have proof and people who will vouch for me :) what I said is not dumb. I'm trying to let people know that the crap people say about these anti-cheats is rubbish and that bypassing them is not as difficult as people claim

The developer of esea is literally a member of unknowncheats. Collectively the smartest and stupidest group of people doing things in kernel and memory. You probably are not getting by esea. The way you write this post leads me to believe you are young and or ignorant with no idea what you are talking about. I haven't seen a thread even trying in close to a year.

They do have a fair degree of manual detection, however, the anticheats themselves are incredibly intrusive and more than likely impossible to bypass without using kernel drivers. DMA is off the table because faceit detects it regardless. If you did this successfully, you wouldn't be talking out of your ass about it on a forum comprised of mostly people who aren't here to discuss memory hacking. You have no clue what you are talking about. Trying to bypass a kernel level ac in what im assuming your claim is ring3 cannot be done as its like drinking soup with a fork.

Yes I am young but far from ignorant. I have been programming for more than 13 years and highly skilled in reverse engineering. I have reversed both esea and faceit. I did say they have clever ways of detecting cheats especially kernel drivers which does make them intrusive I agree but in my missions with these anti-cheats. I did find a few loop holes and people saying it is impossible to bypass these anti-cheats from ring3 is ridiculous. I was only trying to start a conversation with like minded and open minded people to explore these possibilities. As I for many years believed it was only possible to bypass these anti-cheats with a kernel driver and I have developed one but got hit with the ban hammer many time. I found a loop hole in their anti-cheat that allows mine to work in ring3 and I confidently achieved this and yes it is obviously an exploit unknown. My cheat is ring3 and undetected to this day with more than 5 people including me using it. If this is the wrong forum to discuss these things may you direct me to one where I can discuss it?

Why show a video when I give all my potential clients a day trial for the cheat free of charge? I literally give them the cheat for the day and they test it on faceit or esea :) videos prove nothing.

UC might be great for you, I'd love to see sitnspinlock shit in your mouth. If you figured out a ring3 bypass start applying to esea kiddo you'll make more money working for them than selling a cheat.

Can you tell me the difference between loading a dll with LoadLibraryA and ManualMapping a dll?

(Jun 10, 2022 05:20 PM)Mr. Business Wrote: [\[CITE\]](#) Can you tell me the difference between loading a dll with LoadLibraryA and ManualMapping a dll?

LoadLibraryA maps a dll and then it will call the entry point.

Manual mapping initializes the dll into a target processes in memory.

My lan version utilizes a specific and undisclosed RunPE method. I'm a big fan of RunPE :)

See theres an issue with this post. Your claim to use RunPE. Why do I think this is a problem as an outsider without having looked at your claimed code?

Keep in mind, I have been out of this space for a while, maybe what I am saying is out of date.

1) ESEA is a kernel anticheat, you are still going to need to use WINAPI calls in usermode to achieve RunPE unless you have completely reinvented the wheel. Since you have claimed you are completely ring3 this will more than likely get you banned off the bat.

2) ESEA has been dumping physical memory pages for years. Once the one you are using gets dumped you are probably fucked.

Everything you said about ESEA is true and their detection methods are really intrusive but if done correctly you can bypass their sig scans.

I have achieved this with my bypass methods but there's so much more to it though. I obviously cannot disclose these methods.

My RunPE is uncommon and unique. I have tested it and have had no issues detection wise and my clients get a trial using this version as well. I do have other methods for lan. The non lan version of my cheat does not utilize a RunPE.

This teen is obviously talking out of his ass, that said if you're interested in knowing already explored possibilities I'll tell you. EAC, Facelt, 5Ewin, Esportal all use kernel drivers possible to circumvent even in CLR environment let alone Ring3. Highly doubt the same couldn't be done on ESEA but their AC is way too good/intrusive for the benefits so I haven't poked at it since the idiotic incross triggerbots got fixed. As a pug service it's barely more alive than Cevo/Altpug, and you gotta be real selective if the cheat is used in the league, ez manual ban/intrusive pc scan=exploit fixed.

All in all this thread comes off as bragging with a pinch of disrespect to anti cheat devs. I think you should have more respect for the anti cheat devs as they're combating all cheaters on all pc's whereas the cheaters only need to find one way in on their own pc and try their best to stay undetected..

Process hollowing (aka RunPE) is used to execute payloads on a legit process as a means of concealing it from antiviruses. This has nothing to do with game cheating, and it does not bypass

any kernel anti-cheat.

Both this thread, as well as your lame ass sales thread just show that you try to scam potential unaware users, and you are doing a very bad job at it. Maybe try to sell an e-book, you'll probably be more successful.

ESEA and FaceIT anti-cheat is extremely unique as it uses a rootkit to essentially index your entire PC, Hard Drives, Etc. While also live viewing all hooks.

If someone bypasses it, it'll work until it gets known.

The only ESEA and FACEIT bypassed cheats I know of are owned by a buddy he has 5 people on subscription for it, a team basically. That's it no one else gets it.

That's it folks.

share it to more than maybe a half dozen people it gets detected that's all she wrote.
