Thread: [USB stick hacking](#)

zipxyy - June 10, 2022, 2:05 pm

Hello!

I was wondering if it was possible to make a A file that could be put on a USB stick and when the USB stick is put into a computer, it gets google recovery, cookies, maybe even RAT access and stuff like that in the background within seconds. And by in the background i mean that it seems like the USB stick isnt doing anything to the computer but actually is.

Thanks in advance to anyone that might answer me :)

You can use the so called auto run script.

- 1) Open your favourite plain text editor such as Notepad.
- 2) Cut and paste the text in the box below into the plain text editor.

Code [AutoRun]

```
shellexecute=example.exe
```

3) Replace the text 'example.exe' with the file-name you want to AutoRun including appropriate file extension (e.g. index.html, slideshow.ppt, portfolio.pdf etc). If your file name contains spaces e.g. company presentaion.ppt, replace the spaces with underscores: e.g. company_presentaion.ppt. The file you require to AutoRun may also be in a folder, in which case you can give the file path. You can therefore also AutoRun to a URL.

Code [AutoRun]

```
shellexecute=http://www.YourWebsiteAddress.com
```

- 4) Now save and name the file: AutoRun.inf
- 5) Add this file to the root of the folder structure you would like us to preload onto the Locked Partition of the Dual Zone Flash Drive with the file you want to AutoRun (and any other data). This AutoRun method works with products supplied by Flashbay that have been formatted as Dual Zone as part of our production processes – you cannot add AutoRun capability after purchase. For a general overview of the AutoRun feature please visit our dedicated Flash Drive AutoRun page, which also lists important information on operating system compatibility.

This only works on Windows.
