Thread: [New Remote Administration Tool \(by 0xFF\)](#)

0xFF - July 1, 2022, 11:59 am

Hey! I'm 0xFF and I've made some simple yet powerful Remote Administration Tool.

This tool is hosted - which means that you do not need to worry about setting it up yourself - you can just login to a web panel and do all the administration that you need to do. This tool is a perfect fit if you manage servers, android VMs or your child's computer, or simply need a tool to remotely help your family members when they will have problems with their computer again.

My tool currently supports:

- Windows (amd64, i386, arm, arm64)
- Linux (amd64, i386, arm, arm64)
- Darwin (MacOS) (amd64(Intel), arm64(m1))
- Android (bin) (amd64, i386, arm, arm64)

Currently my focus is on supporting Linux and Windows (Darwin version is limited and easy to detect - which means that it will fit perfectly if you want a simple remote access tool. Android version is a binary not .APK (not yet)).

On the list of currently supported features is:

- High security standards (no need to lower AV settings to keep running)
- Individual binaries - everything is being automatically compiled for you.
- Remote non-interactive shell
 - Basic busybox-like tools - that work cross-platform in a same way (no need to remember all the different OSes when doing simple tasks).
 - Downloading files from external server to host
 - Uploading files from computer to the tool's panel
 - Taking screenshots (automatic (every x seconds) or manual)
- Postloads - Custom scripts that can execute different written code on demand in the targeted devices.
- Briar integration - Get notified when devices go online/offline, when a new device connects or command finish executing.
- Custom installer (configurable in settings)
- Commands on boot and on new connect
- The tool is extensible, I can write custom postloads that will fit your needs, or you can write them by yourself! If some feature is lacking it probably can be postloaded.

Currently pricing to get access to the tool is 10\$/month (+20\$ one time for setup - I'll setup VPS to redirect traffic to my server so the host IP won't get reported).

Also - there is on site pricing for some things, such as paying for storage and CPU time when compiling - but unless you start abusing the service you won't run out of the free credits that you have (and even if you do then I don't care - you can have negative balance).

Here are some screenshots from the panel:

I have seen that I got moved to different category, sorry for posting it in the wrong place! If there is some trusted community member with high rank (or just somebody active) that want to test if the software I share is legit I can provide you access for free.
