Thread: [How are hashed passwords obtained through SQL?](#)

Javk - July 6, 2022, 9:48 pm

Sorry I am new to hacking and was wondering on where the hashed passwords are actually stored and how changing the SQL data allows you to extract them.

SQL Injection is the, well injection of SQL (lol) into a user input, where the goal is to manipulate the way the server handles the input to execute malicious SQL code, so if they were injecting into a user input on a login form, if they could manipulate the input, they could try and return all the info from a table, aka the user table, and their passwords

I am assuming this is what you meant
Thanks for this information!

Thanks a lot for this, you've given me a lot more knowledge through this simple post. I really appreciate.

Very good reply from Incog there, it is also worth mentioning that SQLI vulnerabilities are very rare today. At least in most commercial websites etc.
