Hi, i was starting this business with a friend and wanted to know some starting points and would really appreciate it if any of you could help me.

We were specially worried about how much security was needead and if only a vpn would be enough, also we are kind of interested in automization and automatic random responses

PS: Also would love any tips about getting HQ packs or at least some decent enough to start

As far as I know and as much as I've been told, you don't need a VPN for the most part. That's why if snapchat bans you they don't pay much attention to your IP address, in the worst case they can ban your device ID and after that you're not able to log into new accounts unless you change your device/phone.
