Thread: [Rubber ducky/ wifi password grabber / less secure apps](#)

jake.a - July 9, 2022, 2:57 pm

Hello

So I have found this rubber ducky script on github

//Script made by @norepository based on the code of Siem TTommy

Simple script for Rubber Ducky that download wifi credentials, compress and send them to an email. After all console history and the file will be deleted automatically

Make sure to change SENDER-EMAIL and SENDER-PASSWORD with credentials of the gmail account that will send the email and RECEIVER-EMAIL with the email that will receive the zip file

Make sure to allow less secure app by clicking here: //

Unfortunately when I was trying to setup a less secure apps on my gm account it says that google doesnt support 'less secure apps' anymore.

Which email provdier do you guys use as an alternative? I guess you cannot use ANY e mail provider as it has to have an option to enable sending email using just login and password.

Depending on how long this would need to run, temporary emails could be an option?

But if it takes longer to run, maybe a protonmail?

Interested to hear wha others are thinking.
