Thread: [COD Warzone, on Xbox One, with mouse and keyboard?](#)

ENVIOUS - July 21, 2022, 4:00 pm

Has anyone ever tried playing Call of Duty Warzone on their Xbox One, but using a mouse and keyboard?

As a former PC user, my controller abilities are subpar at best. So I decided to hook up a mouse and keyboard (both wired, of course) to my reliable Xbox One and attempted to return to my former self..

However, sensitivity while ADSing is through the roof. And I can't seem to get around it.

Was wondering if there were any suggestions for it.

Thanks in advance to any and all replies.
Cheers everyone!

UPDATE: I've been able to tweak the sensitivity settings a little bit, and although it's better than before, it still just feels off..

It would be really amazing if anyone had any suggestions.

I have tried it without much luck. Ended up just going back to controller.

After tweaking a little more I actually ended up going from averaging 2 kills a game with poor control/aiming, to getting a PR game of 8 kills and placing top 10 .. much better movement and recoil control.

Anyone here knows where to pay for aimbot script?

Go to another thread, use the search function, or start your own thread. Please don't ask irrelevant questions under mine. Thanks.

I'm guessing no one has ever tried to do this with console, huh? Haha. Very unfortunate for myself.

I have done this and still do on all my consoles using xim apex. A hardware.

There is an inherent delay with mnk native on xbox. It is like M\$ installed the wrong driver.

I see it's fairly expensive for that hardware. I just plug mine straight into the Xbox.

I don't notice any delay whatsoever, so not sure on that point.

xim places you on console servers but using keyboard and mouse, the plug and go style will place you in pc lobbies, since it detects the keyboard set.

sadly, to get it perfect probably you will need a pc
Xim wasn't originally for dicks like me lol it's for disabled people mainly.

I tried Mouse & Key on XB1 a few weeks ago.

Gonna have to agree with one of the above replies, just felt like there was way too much of a delay. Ended up going back to controller pretty quick.

However on PS5 & Xbox X, the delay was not nearly as bad.

I had the xim, Its definitely worth the money if you play a lot

This XIM sounds interesting, perhaps I'll have to look into it and see what it's all about.

Thank you all for the replies.

Anyone else had experience playing this way?
