Thread: [10 Tactics of Hacking Mail](#)

bukuktaso - August 5, 2022, 5:09 pm

I WOULD BE VERY HAPPY IF YOU SEND POPULARITY OR LIKES

1. .jpg, .gif, .after combining a file in exe or different formats with a program containing a trojan or virus and sending it to the other party by any method, it is enabled to open or run this program.
2. The keylogger is sent. (This program saves each key pressed on the keyboard to a file and December it to the appropriate person via e-mail at certain intervals.)
3. Fake Mail is a method of stealing information that occurs when the content and appearance of an actual e-mail or fact sheet is falsely prepared. They can be prepared in the form of fake e-mail content, site membership entries, information forms. In addition, an infected file can be added to the e-mail or a previously prepared trojan site link can be placed to visit this link.
4. If there is a person whose e-mail password wants to be compromised, we try to guess what kind of answer he wrote to the secret question. In addition, information about the email owner can be collected in various ways and this information can be used on email playback methods.
5. A password of the person whose password is wanted to be stolen is seized and compared with other passwords used in other environments, or similar passwords can be produced to reach the target.
6. To find out the ip address, use methods such as email, chat, or file sharing. But even if the ip address is found out, the person whose password will be stolen must have some vulnerabilities on their computer. Otherwise, the passwords of the person cannot be stolen or the computer cannot be seized using the Ip address.
7. By preparing the content of a Trojan website, a person can visit this website. Another way is that after combining a program, file, patch, or image located on a prepared site with an infected file, it is recommended that the other person install and use this content.
8. If the ip address is known, all ports are checked with the Scanner. Using known trojan ports, programs available on the Internet, exploits, or outdated services running on the ports, attempts are made to access the target computer by exploiting vulnerabilities.
9. If we are in an online chat environment, Ms. Nicki is a very valid technique to trick the male side. On Msn, in site forums, or elsewhere, the targeted person is tricked with a female nickname and the techniques I described at the top are applied. Another similar method is to receive an e-mail consisting of the name of the lady, and this e-mail can be done as if an accidental e-mail was sent to the other party using this excuse, a conversation can be started.
10. It's a good thing to gain trust. But after combining patience and trust, it is up to the person to use this trust on a good or bad path. There is nothing as simple as getting the passwords of a person you trust.
