Thread: [\(Tut\) How to enable telnet and watch starwars from a CMD prompt | Attachment optional](#)

SIM-587985 - September 11, 2022, 7:54 am

Watch Starwars Episode IV

So I know this is kinda from a long time ago, in a galaxy far away.

Even still, when I was younger it was what inspired me to make an account on here and learn about "hacking" and I hope it can inspire one of you in the way that id did for me. Thank you for your interest.

Since windows has disabled telnet by default on newer systems, I figured I could make an easy guide.

Now there are two ways to enable telnet on your machine. You can either search for "Windows Features" or "Turn features off and on" to be able to manually turn things off and on, or you can just skip ahead and bring up a command prompt in administrator mode.
(Search CMD-->Right Click-->Run as administrator)

Now just type in the following code and hit enter:

Code pkgmgr /iu:"TelnetClient" && CLS

Mac and Linux use terminal and this code Spoiler [\(Click to View\)](#)

Code sudo apt install telnet

Now that you have enabled telnet, you will want to open command prompt/terminal if you have not done so already.

Type this code into your CMD prompt:

Code Telnet Towel.blinkenlights.nl

or if you have windows watch it in green.

Code Color 0a && CLS && Telnet Towel.blinkenlights.nl

Enjoy your movie.

NOTE: It will not have sound.

Troubleshooting Spoiler [\(Click to View\)](#)

"Could not connect on port 23"

Either you are not running as administrator or your firewall is blocking it and you need to add an exception.

You could have also typed in the wrong address, but you can copy paste the code.

I am also going to include an attachment just in case you liked the guide.

It will contain 2 telnet codes that have a bunch of games including chess

I'm amazed this is still up.

Bruh me too. I figured everyone who knew about it either thought it shut down or that it still has the o command after telnet.

I watched it again this morning at 6, no lie.
