Thread: [Is it possible to hack namecheap websites/hosting?](#)

tremesy31 - October 14, 2022, 2:11 pm

Is it possible? Without bruteforcing preferably cus thats so long and never works. Website will probs have shitty security.

GenC0re - October 14, 2022, 2:14 pm

namecheap from my expiriance has strong security. If they detect a shell or some blacklisted functions(a ftp upload from C# app) they ban a account

Hmm okay. I'm not tooo experienced with hacking. Just looking to hack into a basic website thats hosted on namecheap. It has its own little login section, would that mean it'll be easier to hack rather than trying to get into the actual namecheap cpanel bit.

GenC0re - October 14, 2022, 2:30 pm

You can try to write bruteforcer for that login page, or check if site has some sqli vulns. If site has some vuln cms get the version and check exploit-db for exploits, same for vuln plugins.

It is possible, but it is unlikely.

what specific things would make it hard to hack?
