Thread: [Idea for a AI to assist.](#)

Mr. Robot - January 15, 2023, 4:21 pm

So this is an idea I had for utilizing AI in code analysis.

Create a website that gives you small snippets of code, you will be asked to comment it based on what you think it does. You are then given a score based on how accurate the comment you give the code is based on what the AI would generate for the same bit of code.

It would be a good way to dive into code structure and learn.

So sorta like leetcode but for commenting? That seems like an interesting idea, but I feel like at a certain point it could become repetitive and users might lose interest. Let me know if you ever make it, I'd love to try it out!

Yeah except people hate leetcode

Don't get me wrong leetcode is a pain in the ass but it does help interview prep etc. Would you try to make money with your application or just a fun project? Only wondering because models like that aren't cheap to run and I don't see how you could keep users on a long-term basis. Could be interesting to make to see if any other bigger companies might buy you out for the feature though.
