Thread: [Google Maps Problem in Android Emulator](#)

kaischler85 - February 2, 2023, 6:05 pm

Hello, i hope im posting this question in the right Forum. I got a Problem, my google maps doesnt work correct in Android Emulators (MeMu, Nox) it doesnt load the Location at all and cause of this, my Location is set on most Apps in the Capital City from where the IP comes that i use. If i use the Google Maps App, it will show the Location i set up with the inbuilt Location Setting, but somehow if i try to open the Google Maps in an Webbrowser its just loading and never shows the Location (it seems like these Apps have the same Problem to get the Location like the Webbrowser)

Sorry for my english and i hope someone understand what i want to say

Best Regards Kaischler

I mean.... you aren't going to get a GPS signal in an emulator. Or cell towers. You're obviously going off of IP. You can use an application to set a mock location for apps to see but thats about it.

Hello, yes it seems like most Apps use the Sensors of a Phone today, so all these fake GPS doesnt work anymore cause the Sensors still show your real location and if they cant get access to the Sensors (at Emulators for example) then they just move you to the Capital City from the Country where your IP comes, i just couldnt find anywhere on the Web if there is a Way to fake the Sensors
