Thread: [Windows 10 Update - Man In The Middle Attack - Tamper Update](#)

Minerva_Origin - February 18, 2023, 3:01 am

Hi dear managers,

Here there are many experts of security.

In many Anti Virus softwares force us to keep windows 10 update.

I am connecting to a wi-fi network and blocked all ip addresses in this network with regular windows 10 firewall and the only available ip address is :

192.168.1.1 = gateway + 192.168.1.102 = my own ip address

Some people from wi-fi security team told me we are working on hacking people with windows update here.

So some hours when i check windows update it hangs and some other hours later it is working.

It seems they are tampering something in the other side as Man In The Middle attack.

In another day i faced ARP poisoning from them.

Just clarify here can they hack people with windows update such that easy or not?

How can i prevent "Man In The Middle" attack and ARP poisoning?

Just tell can anybody tamper windows update in same wi-fi network or from isp side?

With a Man in the Middle attack, you can set your own update firmware, however Windows verifies the firmware signature, and sadly you won't be able to sign it with a trusted source.

Firmware of what?

Are you talking about mobile phones?

My mobile phone is samsung & android.

Can any body spoof it's new update and manipulate it?

For windows i checked many web sites.

Are you 100% sure that no body can simulate it's signature?
