Tangled Browser and Tangled Social are applications that allow users to earn Millix, a digital currency that can be used for various purposes. In addition, there are upcoming projects powered by Millix that offer opportunities for users to earn more. Here are some ways to earn with Tangled Browser, Tangled Social, and upcoming Millix-powered projects:

Tangled Browser: Users can earn Millix by running the Tangled Browser [1]. The browser is integrated with Tangled Social, which enhances the user experience and provides additional earning opportunities. For example, users on Tangled Browser receive larger stimulus payments than users on traditional browsers. The Tangled Browser also earns passive income from advertisers and messages [3]. To earn more Millix, users can participate in TangledTrivia.com and CobraHelix.com [3]. To get started, users can download the Tangled Browser from tangled.com.

Tangled Social: Tangled Social allows users to earn Millix by being active on the platform. Users receive at least 2,000 Millix every 15 minutes that they are active on Tangled Social [2]. The more people there are on Tangled Social, the more users can earn. Users can also earn Millix by inviting their friends to join Tangled Social [2]. To participate, users need to have a Millix address and deposit Millix into their Tangled Social account by sending it to the address on their profile page [2].

Upcoming projects powered by Millix: There are many upcoming projects that are powered by Millix, which offer opportunities for users to earn more. Some examples include a decentralized exchange and a marketplace for digital goods and services [8]. To stay up-to-date on upcoming projects, users can visit the Millix website at millix.org.

In summary, users can earn Millix by running the Tangled Browser, being active on Tangled Social, and participating in upcoming projects powered by Millix. To get started, users need to have a Millix address and deposit Millix into their Tangled Browser or Tangled Social account.

What is Millix

Millix is a cryptocurrency that utilizes a Directed Acyclic Graph (DAG) architecture, which is a different approach to the traditional blockchain architecture used by cryptocurrencies like Bitcoin and Ethereum.

In a DAG, transactions are arranged in a graph-like structure, where each new transaction confirms two previous transactions, forming a web of interlinked transactions. This structure allows for faster transaction processing times and increased scalability compared to traditional blockchain architectures.

Millix aims to provide a secure, fast, and scalable payment network for users around the world. It also aims to provide a platform for the development of decentralized applications (dApps) that can run on the Millix network.

One unique aspect of Millix is its use of a consensus algorithm called Proof-of-Transaction (PoT). This algorithm is designed to incentivize users to make transactions on the network by rewarding them with Millix tokens. This is in contrast to the Proof-of-Work (PoW) algorithm used by Bitcoin, which requires users to perform computational work in order to mine new coins.

Overall, Millix is an innovative cryptocurrency that aims to address some of the limitations of traditional blockchain architectures.
