Infinite Bomber

Somehow I wanted to make an SMS bomber. I made it. And he also built Tor for anonymity and so that the attacker's IP address is not blacklisted by sites used in the bomb (it changes the IP address every 40 seconds). Then, my partner and I sold it on a forum of stupid schoolchildren.

But after a month I was tired, and I scored on it.

And now, I want to publish the program and its sources (already free) on some forum. I do not want to be wasted in vain. As you can see, I decided to publish it here.

Almost no way I have been finalizing the program for the last ~ 2 months.

PS On the Internet you can find the "scaled updated and renamed" version of InfiniteBomber, and some other fakes, don't get fooled. The real/normal InfiniteBomber is no longer sold in any form.

There are sources in the archive, and in the builds folder already compiled binaries (for release).

Whats it coded in?

Hows it change IP#'s?

Should provide more details about the project.
