I seem to have been infected by opening an app.
I think it is leaking my ip, internet info, and running apps.
As well as altered some app files.

Is anyone willing to add me and take a look?

1. I just disabled a start up app that had its folder altered.
When I was closing the app it was reopening in front of me, and running tasks in the background.
2. I downloaded Process Hacker to prevent pop up tasks.

Restart your computer > Go to safe mode > go to System Restore > restore your computer with restore point before it got infected.

1. Also infected my old email by labeling my inbox using [imap]
2. Added a language to my account settings too
3. Found 10+ background processes that I permanently terminated
