Thread: [HW Cam Hook or Undetectable Virtual Cam](#)

SIM-3327349 - April 28, 2023, 6:53 am

Basically I need to stream local video file to camera source. It have to be undetectable.

OBS, ManyCam, SplitCam and other virtual cameras won't work.

It have to work on Windows or Linux. Best would be, if it works with Selenium/Chromedriver.

Reward: \$500-\$1000 depends on final solution.

Virtual cameras are detected. Unless you use custom driver.

Virtual camera through virtual machine is also detected as it uses same driver. Virtual camera through android emulator works, but I need solution for Windows / Linux. Not Android.

Android / iOS CAM hook also works fine, but I want to avoid Android and iOS.

What do you mean by rooted camera? This sounds like Android solution. I have already working way through Android and also through iOS. I'm looking for pure Windows / Linux solution, so it will make my life easier, while botting it.

This is relatively easy to do by utilizing a filter driver of some sort. Let me know and I can either do it for you or point you in the right direction

SIM-3327349 - May 15, 2023, 11:58 am

Still looking for solution.
