Thread: [Which Is Best RAT with HVNC Support & can bypass Antivirus](#)

TheGeek1 - May 11, 2023, 7:26 am

Hello Hackers,

I am looking for the best RAT that can bypass antivirus and be installed with one click by victim. With Binder?

Which will work best in 2023, and where can I buy it? Please give me links or addresses.

Thank you, all hackers, in advance. ??

Hey bud, welcome to the world of hacking and RATs, botnets, stealers and all sorts.

Unfortunately I believe, personally that the hVNC RATs are overpriced. The best one I can recommend however is PureHVNC:

<https://hackforums.net/showthread.php?tid=6230460>

Only because essentially they all operate with more or less the same features, with a couple of differences here and there. PureCoder makes consistent and well priced tools. That's \$99 in comparison to Pandora hVNC and VenomRAT which go for over \$400. I wouldn't recommend it because I assume you're just starting out. I'm not sure if PureHVNC has a binder in the tool, but binders are relatively inexpensive and can be found in the Premium Tools.

You will want your file to be FUD (Fully Undetectable) and compatible with .NET either through your binder or a crypter before you start spreading. Also ensure you scan it on antiscan.me, do not submit your file to VirusTotal.

Good luck.

You have old thinking. First of all, none of the rats or HVNC can bypass antivirus by itself because of overused runtime. Even if you crypt them, they will bypass antivirus for a maximum of one day.

A workaround for this is to use a loader such as Tornado Botnet with only 10 kb of binary size, because 10kb is very easy to obfuscate and crypt, and after that, it can bypass antivirus for months without problem.

After you have bots inside loader, you are able to execute maybe commands to whitelist your specified malware, so you no longer need to crypt them or crypt them and execute on targets, and after a day or two, when your file gets detected in case you crypted it, you will still have a connection

in loader such as Tornado Botnet, and you can execute other files when you need them again.
