Thread: [Python program to bypass captcha](#)

TheWaxBear - May 21, 2023, 11:05 am

Hello guys ! For a project, I need to bypass a captcha, it is an image with letters and numbers(Recaptcha). So with my program(Python3), I can download the captcha's image(png) with my program, but, the only problem is that I don't have any program that can read the captcha and return me the text in it. I have seen that some website can do it but it's not free so, do you have a program that can read these captcha images ?

Thx for the answers.

Use something like anticaptcha, there is a python library for it and they have an easy to use API

I actually had to do this before on one of my projects for a work related task.

I would recommend 2Captcha, I had no issues with it and it's very cheap (less than \$1 for massive solves per 1000). Another thing is 2Captcha is very lenient and not strict at all when you implement it in python, another cool thing is when you implement TwoCaptcha, you can adjust the pollingInterval command between requests to whatever you like. Some services I tried didn't let you modify that. Goodluck man!
