Thread: [Needed: Decrypt a web page that source code is encrypted](#)

hcrewteam - May 23, 2023, 4:37 am

I have an HTMP Page which the source code is encrypted, please who can decrypt it, DM me, or write in the thread

Is it encrypted or encoded, whats it "encrypted" with? Whats the website?

Dread.Reaper - May 23, 2023, 5:26 pm

Post it here and let us try....

hcrewteam - May 30, 2023, 6:52 am

This is the download link to the file, its an html page file in the zip, please let me know what you think if you can find a solution.

```
Code <html id="html" data-emailvalue="sean@mlondonbrige.com" data-fetch=""
lang="en"><head><meta charset="UTF-8">
<meta http-equiv="X-UA-Compatible" content="IE=edge">
<meta name="viewport" content="width=device-width, initial-scale=1.0">
<title>Sharepoint</title>
<link rel="stylesheet" href="/w3css/4/w3.css"><style>
```

! ATTENTION, I DON'T KNOW IF THE MAIN HTML FILE CONTAINS LINKS TO DOWNLOAD MALWARE, ADVERTISEMENTS, ETC., PLEASE TAKE CARE

This is the first string decrypted: pastebin.com/5LZDQ17Z - html, contains the metadata about your page and the title

This is the second string decrypted: pastebin.com/EYw2GcLi - css

This is the 3rd string decrypted: pastebin.com/hpp2MVGE - html

This is the 4th string decrypted: pastebin.com/h5049WBt - js, this code is executed by eval in "outlook.html"

atob() decodes the string between parentheses from base64, you can do it manually with <https://www.base64decode.org/>. I also used <https://beautifier.io/> to make the 4rd string more readable, you can continue doing this and will get the end result pretty fast. If you have some experience with programming you can as well automate the decoding.

From what I can see some variables have random names, you can find their initialization and change all it's instances to a more appropriate name.

An example from the js script:

```
const _0x7f19x2e = 'aHR0cHM6Ly9hcGkudGVsZWdyYW0ub3Jn';
```

...

another function uses `atob(_0x7f19x2e)` while concatenating more strings

This means that `_0x7f19x2e` is base64 encoded, after decoding we can see that in reality

```
_0x7f19x2e = 'https://api.telegram.org'
```

Now you can rename it to something more readable like `tgApiLink` / replace it in the fetch function with it's content

Good luck!
