With Quasar rat what type of target injection and encryption should i use.
also what is Melt and Persistence. and should i use them with quasar rat?
Note: I am trying to have it bypass WD with start up

to be honest. if you bought crypter, it's a bit difficult, getting through with the startup can be a bit of a problem, depends on the crypter and the quality.

Injection - Memory injected into a windows process, so the user is not aware.
Melt - Original file is removed after installation.
Persistence - Process will keep starting even if the user kills it.

I wouldn't even bother trying to crypt Quasar with whatever shared crypter you are using. Do it properly and get a private crypt.
