Thread: [Queue it Bypass](#)

johnlabel - June 15, 2023, 11:13 pm

Hello there, how are you all doing?

I need help on how to bypass any website that uses Queue-it system and i find this website the most likely to answer my question. I'm new here. I hope someone helps ?? thanks!

Assuming that queue-it is JS-only, then there are solutions online if you look for this. With script blocking you can prevent the queue it javascript file from ever being loaded. You can do this with Chrome dev tools (script blocking) or you can use plugins or choose from other options on different browsers.

I am not 100% familiar with queue it, but if it's anything like Cloudflare then it is possible the traffic is routed through queue it DNS in which case it would be much more difficult to bypass a queue. It depends if they are queueing visitors of site content on-page, or funneling you through a genuine backend-verified service. I think if they truly are offering enterprise site queueing, it most likely is not just on-page JS, but it's possible?

It most likely depends on the exact site and integration. For example, if a site has a subdomain that doesn't use Queue-it, or a user agent override for crawlers by Google, Bing, social platforms, etc then perhaps someone could use those. If the site only has a soft-wall (JS overrides that can be blocked or manually removed to reveal real content) then that's another option. However, if there is backend/server verification for queuers then I highly doubt there is a 0day for queue-it or if there is a known exploit then I'm not sure the bidders would give it out publicly. I'm not familiar with this type of thing.
