Thread: [Easiest Username Availability Checker](#)

SRT - June 22, 2023, 9:05 am

Need An Easy Username Availability Checker Made. The website doesn't need proxies. The URL looks like this below

CHECKER HAS Been Made!

The checker should use my wordlist and add my combo where it says "USERNAME" in the link above

After sending that request the webpage either says "true" or "false"

True means the username is available, false means its taken.

I want the checker to show on screen which one is available and I want it to add the unavailable and available ones in separate .txt files.

The checker must be fast and stable.

Since it's so simple, I'm only willing to pay \$50USD as I already have a checker for this website, just found out that the website has that API link above, so I want a faster checker made.
