Thread: [Improve Your Security WordPress Spam Protection With CleanTalk Anti-Spam](#)

Proxy3200 - July 8, 2023, 11:39 pm

Every website owner or webmaster grapples with the issue of spam on their website forms. The volume of spam can be so overwhelming that finding useful information within it becomes quite challenging. What exacerbates this issue is that spam can populate your public pages, appearing in comments and reviews. You likely understand how this can damage your website's reputation, affect search results, overload your web server, and divert your focus from website development.

Website owners and webmasters need a solution to this problem. When selecting an anti-spam solution, the following requirements should be taken into account:

The solution must operate automatically, eliminating the need for manual spam checks.
It should provide a quick and efficient method of accuracy control.
It must be universal, protecting all website forms simultaneously.
It should be easy and straightforward to install and set up.
It should not require any extra steps from your visitors, ensuring they do not have to confirm that they are humans, not bots.

CleanTalk Anti-Spam Solution#

CleanTalk Anti-Spam is a cloud-based tool designed to block various types of spam that website administrators encounter daily. This includes spam in comments, contact forms, signups, registrations, subscriptions, newsletters, and WooCommerce reviews and checkouts.

This solution delivers the following benefits:

All spam-related computations and decisions are processed on remote servers, reducing the load on your web servers thanks to cloud technology.

The Service Dashboard provides detailed insights into website requests, equipping you with tools to manage service features. It clearly indicates whether a request was spam.

The plugin can be installed and set up easily on any website in just a few minutes.

With this single solution, all forms on your website are safeguarded.

Spam checks are conducted without interrupting your site visitors, requiring no action on their part.

Several important service features require separate mentions:

SpamFireWall - This feature blocks the most actively spamming bots before they can visit your website.

Email Address Validation - This function verifies the authenticity of an email address in real time.

Encode Contact Data - This feature encodes the email addresses displayed on your public pages, protecting them from being parsed by bots.

All of his posts are copied, I have caught this user many times now ?

The post report window should be extended for upgraded user roles to allow for 3-14 day reports depending on subforum in my opinion.
