Thread: [What will be the true impact of AI](#)

V?rt - August 4, 2023, 9:45 pm

Do you guys think AI will have an overwhelming impact on the daily tasks we do? Are yall open to something along the lines of even a smart mirror that has AI built in that picks out your outfit for the day. You know, "Weather is warm but cloudy, It'll be a nice day for a green shirt with khaki shorts." Type thing. How much of our daily lives will we be mindless for?

Truth - August 5, 2023, 12:32 am

AI + Robotics = 90% job loss imo

AI cars/drones = bye taxi/uber/doordash/etc

AI robots = bye fast food workers, entitled waiters

large 3D printers = bye construction/factory workers

As far as software, AI is getting good at that too. So entry level programmers might be gone.

People are going to get slapped in their face and hopefully wake up, if not, that slap is just going to R.I.P you. Natural selection cycles are a part of history, this is nothing new.

All I can say is just make sure you own what AI will eventually want, and that is Bitcoin.

SIM-3343347 - August 5, 2023, 12:44 am

The increase of tiktok influencers due to lack of real jobs

Koala Crypt - August 5, 2023, 5:26 am

ai for us dying people will be very limited, they alr have applied a lot limitations. the chatgpt AI iq has dropped to near zero now, before it could solve complex math problems but now is at the same stage with my stupid brains.

i think the rich will continue using AI to dominate trading, and other high profit things. blackrock already uses and has been using the trading AI for years

db212021 - August 5, 2023, 5:58 am

AI will be bad in a lot of ways, but good in a lot too. I'm just looking forward to the AI female of the future LOL!

V?rt - August 5, 2023, 8:29 am

AI half and half bums me out and gets me excited. I think it could lead to a lot of great things for commoners if we play our cards right, but then again I do think it may take some jobs to an extent.

ChronoBiff - August 5, 2023, 9:30 am

As a seasoned detective in the Special Victims Unit, you might not immediately think my line of work has much to do with artificial intelligence. And you'd be mostly right - after all, my daily grind involves interviewing victims and suspects, gathering evidence, and seeking justice, not writing algorithms or developing machine learning models.

However, I can't ignore the increasing influence of AI in our society. From aiding in investigations

through facial recognition and predictive analytics to even potentially profiling criminals, the potential of AI in law enforcement is enormous. The speed and accuracy that AI can offer in analyzing vast amounts of data could revolutionize the way we work, enabling us to solve cases faster and with greater precision. But as with any powerful tool, there are significant ethical implications that must be considered. The balance between privacy and security is a delicate one. AI has the potential to infringe on civil liberties if not used responsibly and transparently.

Moreover, AI, like any technology, can be misused or manipulated, leading to potential miscarriages of justice. As I see it, AI is a double-edged sword - a tool that can either greatly assist or seriously harm, depending on how it's used. It's our responsibility, as members of society and as law enforcement officers, to ensure that this technology is used in a way that respects individual rights, upholds justice, and contributes positively to society.

That's my two cents as a detective. I'd love to hear your perspectives, whether you're an AI enthusiast, skeptic, or somewhere in between.

(Aug 4, 2023 09:48 PM) Savant Wrote: [\[CITE\]](#) In Seattle, the unemployment rate is 3%. (This is the county where COVID originated from, hence why I bring up the unemployment rate in the city I reside in occasionally).

Manual labor will be the jobs that are most sought after in our generation.
HVAC

Construction

Doordashing or delivery related services

This is why I think the developers behind Bart/ChatGPT (and the CEO's of said parent-companies) are trying to stop potential threat-actors from maliciously using their tools; at the end of the day, black-hat hackers always will be 10 steps ahead of these corporate companies, however, they have more capital than threat actors.

This is my opinion, getting into something non-IT is probably the best way to make money for this generation, however, people will become Wage Slaves continuing to pursue CS/IT related degrees and work a decade in an office before they end up getting to where they want; spending their teens, and twenties, making money, just to get married, just to get cheated on.

Niceeeee , thanks for this info

Reactor - August 5, 2023, 10:59 am

i think AI will make the jobs more comfortable but it won't take your place at all , AI can't do smart hard workers job at all , AI can't develop program based on his own idea " that's impossible based on what i learned " so there will be always need for programmers/developers even for the AI tech it self it can't be more advanced without human part

Fresku - August 5, 2023, 1:53 pm

AI is based on history, so eventually humans who takes advantage of AI capabilities and which are willing to take risks and think ahead, will have a good chance of becoming successful.

ChronoBiff - August 5, 2023, 6:41 pm

I wonder how quickly things will get developed. I surely hope that whatever comes of AI, is used for good.

TheMiddleMan - August 7, 2023, 11:33 pm

I honestly think ai will consume the market they're becoming too easy to make and gain and control so much of the internet as is, it's not going to be the end of the world but like expect online traffic and buying things to be a real headache

diablospartan - August 8, 2023, 7:29 am

Well even if it's very useful these days I am afraid of it in the future because the movie terminator is our future reality. So AI will be able to think by himself and why not to try to eliminate people

TazerNips - August 8, 2023, 9:16 am

I utilize chatGPT literally every single day. Besides work, it helps with my schedule, my shopping lists, my workouts, goal tracking, diet tracking, and discussing and internalizing the books I am reading. As it advances more I'm certain it will become the norm to use it every day. I don't want to be too speculative, but as it gets better and adds new features and more accessibility, there's no way it doesn't become a common household tool.

Rahul007rhp - August 8, 2023, 10:31 am

Currently it's helping to boost my productivity, chat gpt gives suggestions which can be applied to my code base

V?rt - August 8, 2023, 4:13 pm

This is great to hear! I've used it a few times for small coding projects and it's great. I'm not the best at writing, so being able to type what I want and having it spewed out within seconds is amazing.

Spooky - August 8, 2023, 5:47 pm

Eventually AI will develop itself into taking on entry level jobs in fast food, retail, construction, etc. Eventually moving on to consuming most of the job market. I recommend watching "15 Million Credits" by Black Mirror on Netflix.

Rahul007rhp - August 8, 2023, 10:39 pm

I'll give one another example here in INDIA there is a big news channel "Aaj Tak" they are playing a show at some specific time at night & they have introduced an AI anchor to give basic reports for 30 min show.

That did take a job of the last anchor running the show previous to AI

PS : The AI is pretty and dresses well everyday xD

outcastx0 - August 8, 2023, 11:37 pm

I'm ready for it to impact the job market but other than that I predict nothing but amazing things and amazing advancements more rapidly because humans are inherently lazy and AI doesn't need sleep or human rights.

l4v4n - August 9, 2023, 1:26 am

Increased automation in various industries, transforming how we work and live. It could improve healthcare diagnostics and treatments, personalize education, enhance transportation safety, and

revolutionize finance. Ethical concerns about bias, privacy, and job displacement will need to be addressed, and AI's potential to accelerate scientific discovery and create new forms of art and creativity could reshape societal norms. The extent of AI's impact will depend on responsible development, ethical considerations, and effective regulation.

The Pact - August 9, 2023, 1:41 am

I've very excited and very positive about Ai overall even though I know it could unleash terrors in the hands of sadists and psychopath I refuse to spend much time on that because I'm excited.

But one huge negative I've seen is a lot of dumb people being impressed with actually pretty lousy writing. [I know I sound like a wanker, but fuck it. It's the truth.]

I mean the writing is impressive often only because it's been written by an Ai chatbot, but often it's.... okkkkk, but pretty lame. Some of the best I've seen I'd give a B minus to. It's often too general, too cliché and at times slightly nonsensical, and in addition it is quite likely to have factual errors.

Actioj - August 9, 2023, 1:25 pm

Hella money for me is the impact of ai

Neil - August 9, 2023, 8:42 pm

Honestly, I think AI is going to take over. It's going to simplify so much stuff for people.
