Thread: [Python Any good for building hacking tools ?](#)

inceptor - August 11, 2023, 8:41 am

So Like the titles says , i have a job in govt sector but its not something i love doing rather totally hate it

I don't want to quit the current job or anything at this point in my life because i don't have any savings nor do i have any other skill

I used to be active here many years back and then i had to undergo several surgeries due to a medical condition (5-6 of those for 5 years or so)

if you go across my old post you will find out that most of my thread were on Money exchange etc

Some of my mates from college are making real big \$\$\$ now and they were all not that smart but they have become a programmer and idk they make a whole lot more (I am not jealous , I am sure they must have worked hard for it) i was wondering why i could not do the same . i am in a totally different work stream ..

So i started to Learn python i have completed very basic chapters and have been practicing for couple of weeks ..(Have very limited knowledge on programming) I was wondering if python is a good choice to make an executable files like keylogger crypter or something along those lines or if i can make an app and put it on playstore ... I am Interested in learning python and i dont feel like quitting it in between i initially set a goal of learning most of it and doing some good projects within 6 months .i dnt know if i am being realistic here ..

Need some Input and harsh truth and if possible any motivation !!!

I'm a bit confused by your question, are you asking if python can be used to create these tools? Or are you asking if its the best for creating these tools? Are you asking for advice as far as getting into the software development industry? I'm just really confused, you've got a lot of themes going on here.

I am asking if a good crypter keylogger or a binder can be made using python which can be as good as any other coded in a different platform like c c++ etc .

BiNBo - August 11, 2023, 8:58 am

In short, yes. You absolutely can create a good crypter, binder, keylogger, etc. with python. There's a number of libraries that exist for exactly these types of projects too. Not to say the C++ and other languages aren't perfectly suitable as well. It really depends on how you leverage your knowledge and expertise.

Do you know anyone from here who has coded any of that tool in python ?

I've created some basic stuff in the past, but coding malware isn't really my schtick. I'm sure some of the devs around here are more familiar with the topic. That being said, check out some open source projects and maybe get ideas from how they coded their tools.

Aeon - August 22, 2023, 10:58 am

Python is more for exploit development in terms of Malware development. C/C++ , Rust , Golang , ASM is for making the actual executables.

Write software for the Whitehat side of things! There is a lot of job opportunity if you can write good software. Whether it be for Tech users, everyday people, or specific niche software. Writing Bot clients, backdoors, and or ransomware isn't going get ya to far. Unless you are doing it for educational purposes and using it on a private network of your own. However, that is usually unlikely the case....
