Thread: [Quasar RAT: Is Admin privileges matter?](#)

CatLicker - August 15, 2023, 8:51 am

Hey guys, I have installed a Quasar RAT client on a computer, and I thought that without Admin Privileges I won't have many options so I clicked on Client Management >> Elevate Client Permissions , which asks the computer to give Admin Privileges to the Client.exe . I clicked "Yes" and everything worked fine.

The only thing is that I had 2 connections: one with the Admin Privileges, and the other one with User Privileges (Both for the same computer) , the one with the Admin Privileges works perfectly but the User not.

Now, after the computer has restarted I assume that it asked the computer again for Admin Priveleges for the Client.exe, but the computer allegedly clicked "No", I suppose.

Now I only have the User connection which doesn't work at all, I can not do anything with it, no option is working there.

my questions is:

1. Do Admin Privileges really matter in Quasar RAT?
2. What can I do now to get the connection back? (It is connected but the options just won't work)

1. it mainly matters on the task at hand, if your grabbing creds or just viewing the screen, not really, but if you need to access admin settings (such as disabling defender), then yes. it matters on the task.

2. you need to somehow reconnect the client, thats a strange bug and is either in the server or client. close the server and reopen it, if the problem persists, and you truly can run no commands, your out of luck sadly
