Thread: [Use Python to stay Anonymous \[Source Code\]](#)

Aeon - August 24, 2023, 6:58 pm

Hey everyone Samy here again :)

In this quick tutorial I will show you how you can use Python to Hide your IP when connecting to websites, using the requests library.

First thing you want to do is import requests and make a variable for url, username, password (user:pass variables used for proxies that use authentication)

Then make a result variable equal to requests.get(url, proxies) this requests the url using the proxies variables above.

Then from there you can do anything with it such as print the result URL's text.

Python 3.11 Code here:

```
Code import requests
url = 'https://youtube.com/'
username = 'proxyUsername'
password = 'proxyPassword'
proxy = f"http://{username}:{password}@proxyAddress:ProxyPort"
result = requests.get(url, proxies = {
    'http': proxy,
    'https': proxy
})
print(result.url)MAKE SURE TO REPLACE "proxyUsername" & "proxyPassword" to your proxies
info and "proxyAddress" "ProxyPort" to your proxies IP:PORT
```

Please leave a <3 if this helped you and leave a reply or DM on how I can make this tutorial / guide better in any way!

What's the point of this actually?

It has many uses it depends on how you implement it, this is just starter code to connect to a URL with a proxy.

You can for example use it to connect to twitter/youtube on different IP for bot accounts.

Ah I see, you were showing a snippet of code for proxy usage to build upon.

Yes indeed, also I am open for suggestions to make this starter tutorial better. I am going to build upon this post some day to make a better one with more code and ideas people will be able to build upon.
