Thread: [Root jp6 8.3](#)

mariia - September 7, 2023, 10:37 am

If anyone could help root a Securus jp6 tablet 8.3 please let me know. I've been researching and looking everywhere from what I found they don't have a root for it. If anyone could guide me in the right direction?

Livehouse52 - September 7, 2023, 3:40 pm

Do u have the new break?

Urshiphox - September 15, 2023, 11:32 pm

I can assist with hacking 8.3.0 which roots it anyways which I don't understand how you got it hacked without root. Unless the person that hacked it deliberately removed root

Tele is at UmarEwill74

Or tx

AmazinVibez - September 16, 2023, 10:22 pm

There are no hacks or roots available

jRaven13 - November 8, 2023, 8:24 pm

You umarn hmu @jRaven_13

LittleDick05 - April 27, 2024, 3:02 pm

My jp6 os rooted and has beastmode installed on it from another user, I'm trying to hack the hacker by getting into it and using it. Can you help?

KGokinawa - April 29, 2024, 9:12 am

You are trying to gain access to an already broke JP6 that has beastmode installed on it. Is this correct? If so, hmu and I can make it happen.

Is there a way to add a cmd line to a hexaflash bin file??

Theoretically, yes.

Highly unnecessary.

Simple adb cmds in terminal resolve the matter.

Hmu for assistance @[deleted]

Anyone that needs hexaflash or the install hmu I am interested in trading legit experience. With the 8.14.12 update we have to adb shell in obviously some kind of way. I have a full Kali Linux VM build for the jp6 and after updating it I can see how useful it is... I understand adb command line coding and would like to bounce ideas back and forth... T.me [deleted] I'm over here a Chobee let me know. [warn]

Did you find anything? I'm running into the same trouble. I'm good at research, but I've found nothing related to my current build.
