Thread: [Vulnerability Scanning with Mass URL s \(with the latest CVE s\)](#)

kane88ss - November 6, 2023, 2:10 pm

when i knew nothing about hacking,i used sqli dumper (like every fucking script kiddie in this planet lol?)

and when i learned more about web hacking world

i had an idea:

sqli dumper create mass links with dorks and then check if the links are vulnerable to sql injection

i want to level up the game,and be able to hack more sophisticated databases, ?
with generating links with dork searcher and then perform a massive scan with the latest cve has discovered

i am ready to write mass exploit program (like sqli dumper) with the latest cve

but i have some question and doubt about this method:

is it a good idea? is there a better method?

have u some experience with scanning mass urls vulnerabilitys?

is it common?

have u some ressource about scanning mass urls vulnerabilitys?

i am not affraid about technical difficulties, i just want to be in right way

Yeah I would think it is a good idea (assuming from your OP) to create a program to generate a CVE based on the vuln found/proven. You would probably have to use a API for the scanner and try your best to not show any false positives (which I hate), also if patched... alot more variables etc. I don't typically use scanners but depends on the target really, but your idea is doable.
