Thread: [How i can hack bluetooth devices.](#)

TheDeadPool - November 7, 2023, 5:00 pm

Hello

Could someone please explain to me how to hack bluetooth devices that are already paired with another device, like speakers and headphones? Which method and tool is the most efficient for hacking a Bluetooth device? Simple to Complex?

You can't. Not without cracking the AES key. You might want to try BlueBorne, bluebugging, BlueFrag, or BleedingTooth.

Thank you so much, but is there any way to disconnect the paired device then pair it by own?

Like I said, Bluetooth connections are protected by symmetric AES-CCM and thus resistant to known key recovery attacks. Connection takeover and impersonation attacks are prevented by requiring the connection key. I think that the only relevant attack for you would be BlueDump.

Hello, is BlueBorne, bluebugging, BlueFrag, or BleedingTooth are they still working ?

These are well-known attacks. I wouldn't expect much success. BLUFFS, however, is new.

For one, this is off-topic. But who knows? There are different kinds of PA systems. I have seen

several other threads on that topic.
