Thread: [FUD Windows 11 Gmail Keylogger with video](#)

NullPounce - November 16, 2023, 6:14 pm

Not sure if sharing links is allowed so just replace the "[DOT]" and add the https before the :

`://vimeo[DOT]com/875678474?share=copy`

you can edit the python script to insert your own Gmail and app password and change the buffer size as well, only need to disable anti virus for building the exe. just tested again today full windows defender live/cloud protection bypass zero detections, sends all keylogs to Gmail no problem no admin or uac required, once user clicks on the exe it makes a copy of itself to the users startup

folder and does not make any text files, all keylogs are stored in memory, on a small key buffer there is a

small noticeable delay when the email is sent but i imagine with a higher buffer this will rarely be noticed
